*Katie Maldonado Lytle, DVM, MPH, MS*

*Report Date*

Day Blindness/Retinal Degeneration (DB/RD) is inherited in an autosomal recessive manner meaning that two copies of the mutation are needed for clinical signs of the condition to develop.

The results of Kimberlys Carissa Ann's Day Blindness/Retinal Degeneration (DB/RD) test indicate that they are clear. This means that they should not develop clinical signs from this mutation.

When making breeding choices, Kimberlys Carissa Ann can be bred to any appropriate mate as they will not produce any puppies at risk of developing Day Blindness/Retinal Degeneration (DB/RD).

Please note: It is possible that disease signs similar to the ones associated with this risk variant could develop due to a different genetic or clinical cause.
